# INTRODUCTION

The source of the information set forth in this pamphlet, a companion to School children 7 to 13 years old in 1935, compared with population in the same age group enumerated in 1910, 1920 and 1930; each health area in New York City, is the Child Accounting Project, WPA No. 1621, sponsored by Mr. George H. Chatfield, Director of the Bureau of Attendance of the Board of Education, and supervised by Mr. Richard B. Franken.

Cards were made for each child enrolled in day schools -- public, private, parochial -- up to and including those 21 years of age, but exclusive of those attending colleges, showing name, age, sex, grade, school and residence, coded for census tract. Tabulations of these five factors -- age, sex, grade, school and residence -- were made. The Research Bureau of the Welfare Council has combined the data into figures for health areas and health center districts, the standard areas in use by the Health Department and many other social and health agencies.

A description of the development of health area statistics will be found in the introductions to the several guides, House Numbers in Health Areas, one for each borough, published by the Welfare Council. Health areas combine census tracts in such way

as to reduce the 3,413 tracts with widely varying populations to 311 units approximating populations of 25,000 persons.

For Manhattan children four additional tables have been separately published:

Table 2. Manhattan children enrolled in day schools in 1935, classified by health area of residence and by attendance in each type of school, located in or outside of health area

Table 3. Manhattan children enrolled in day schools in 1935, classified by health center district of residence and by attendance in each type of school, located in or outside of health center district

Table 4. Number, type and location of day schools attended by Manhattan children in 1935, each health area

Table 5. Number of day schools of each type in health center districts, Manhattan, 1935

The original project terminated before it was possible to make similar tables for the other boroughs so that the figures on age groups presented in the present tables for Bronx, Brooklyn, Queens and Richmond constitute all the information that is available for these boroughs in addition to the original publication on school children 7 to 13 years old in 1935, 1930, 1920 and 1910.

As was stated in the first pamphlet, the original interest of the Research Bureau in these figures was their possible use in estimating more accurately the population in health areas for intercensal years. When it was discovered that this was not feasible, even for the compulsory school age group 7 to 13, it was still considered that these data have the virtue of furnishing a reasonably accurate figure on the size of one portion of the popu-

lation, and if taken year by year and classified by health area of residence and by age, may yield data of considerable assistance in adapting public health programs for specific age groups, making shifts in school accommodations and for public planning purposes.

Dr. Sophia M. Robison of the Research Bureau staff and in charge of its work on Neighborhood Statistics has had immediate responsibility for the direction and supervision of this work. Much of the statistical and clerical work on these materials has been done by persons assigned to the Research Bureau by the Works Progress Administration (Project No. 465-97-3-99).

The expenses of the supervision and publication of this piece of work have been borne by the Research Bureau, financed in large part by funds given by the Rockefeller Foundation.

Neva R. Deardorff  
Director, Research Bureau
